Practical 5: Perform Website Footprinting

Date: 07/11/2024

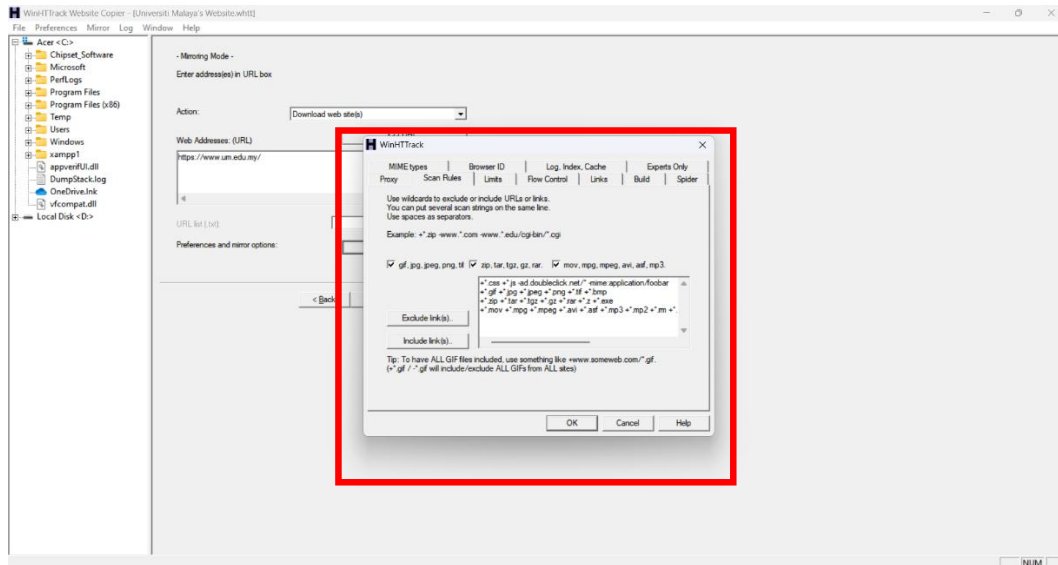

1. Enter the name of the project (here, Taylor's Website) in the New project name: field. Select the Base path: to store the copied files: click Next>

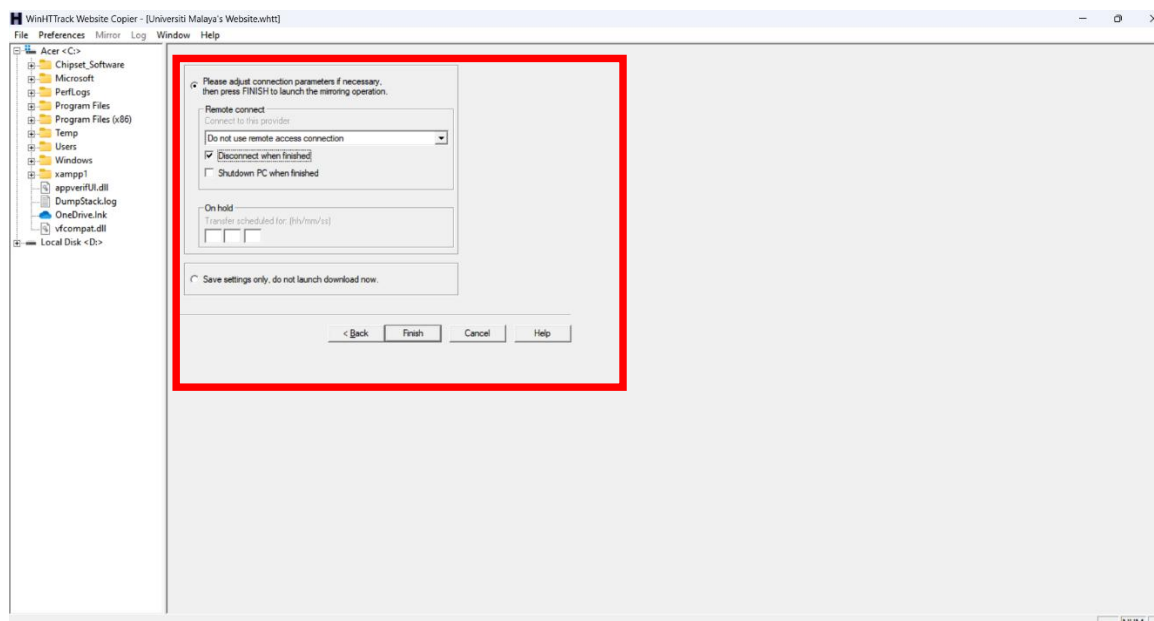

2. Enter a target URL (here, www.taylors.edu.my) in the Web Addresses: (URL) field and click Set options..

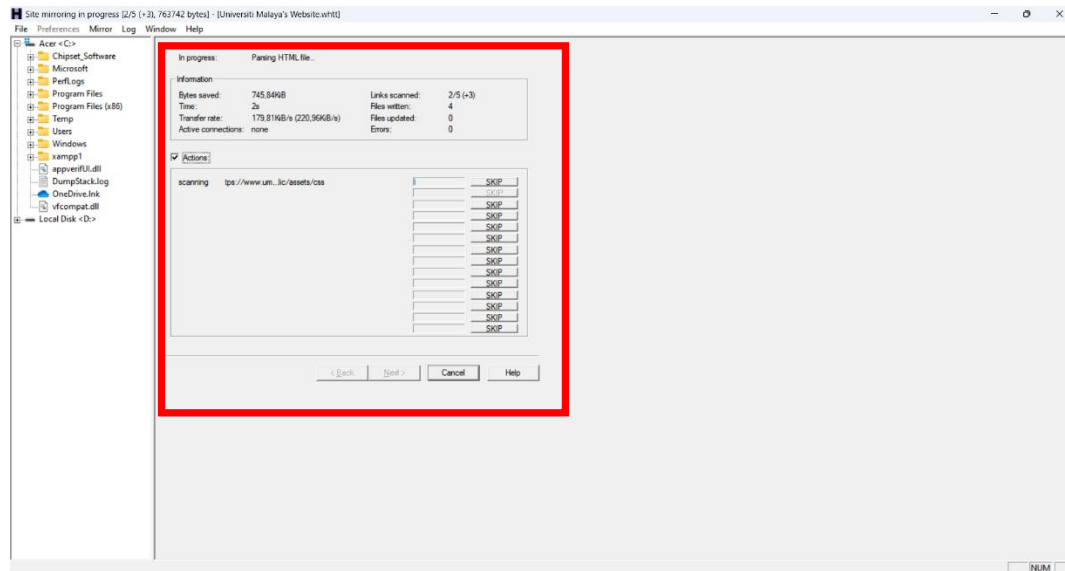

3. WinHTTrack window appears, click the Scan Rules tab and select the checkboxes for the file type as shown in the following screenshot; click OK.

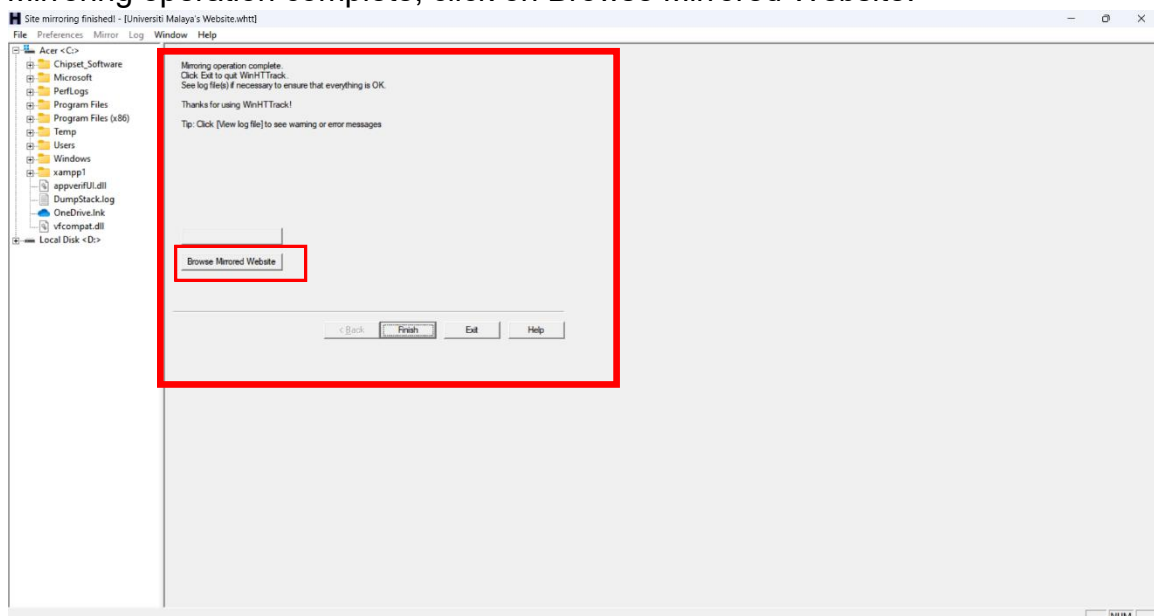

4. By default, the radio button will be selected for Please adjust connection parameters, if necessary, then press FINISH to launch the mirroring operation. Check Disconnect when finished and click Finish to start mirroring the website.

5. Site mirroring progress will be displayed, as shown in the screenshot.

- Once the site mirroring is completed, WinHTTrack displays the message **Mirroring operation complete;** click on **Browse Mirrored Website**.

- The mirrored website for www.taylor's.edu.my launches. The URL displayed in the address bar indicates that the website's image is stored on the local machine.
